

Tobacco Transplant Production in Greenhouses

Andy Bailey

Dark Tobacco Extension Specialist

Bob Pearce and Gary Palmer

Tobacco Extension Specialists

University of Kentucky

Outside Bed Construction

● Plastic Bed Liner

- 6 mil best
- Drape over bed and form fit
- Fill bed with water
 - To desired depth
 - 5" common
- Tack Plastic down

● Bows

- Form to support cover
- 2 to 4 ft apart
- Prevent swags
 - Water Accumulation
- Prevent damage to covers

Outside Bed Construction

● Covers

- Sturdy
- Freeze protection
- Rain protection

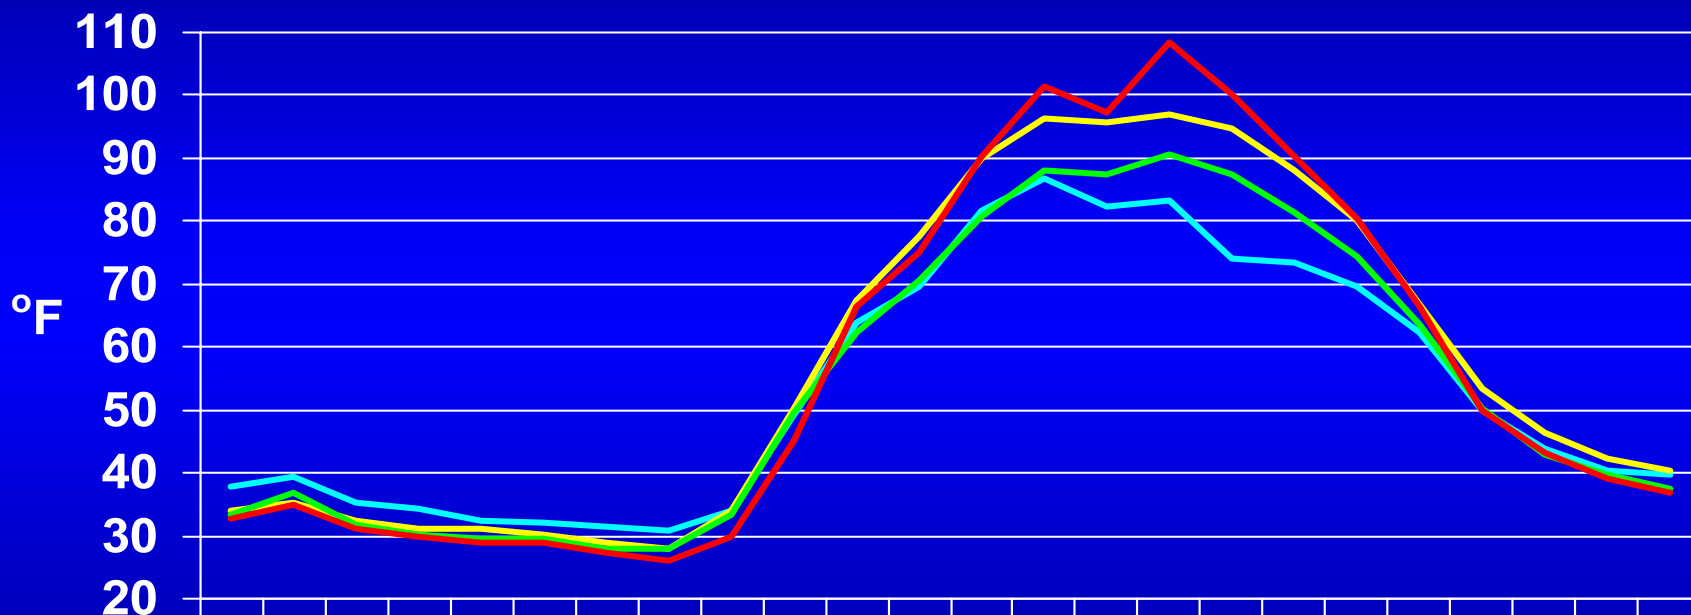

Outside Bed Construction

- Level area
 - Water will find level
 - Avoid swimming pool syndrome
 - Deep end & shallow end
- Free of debris
 - Sand or lime for good surface
- Used 2 x 8's to form box
 - Inside dimensions
 - Consider trays 14" X 27"
 - Determine number wide and long
 - Approximately 30-35 trays per acre
 - Depends on cell number/tray

Types of Covers for Outside Beds

- Continental
 - Expanded Polyethylene
 - More heat retention
 - More rainfall protection
- Typar
 - Expanded Polypropylene
 - Cooler
- Vispore
 - Plastic with tiny pores
 - Heat buildup
 - Doesn't retain heat energy at night
- Plastic
 - Rainfall protection
 - Heat buildup

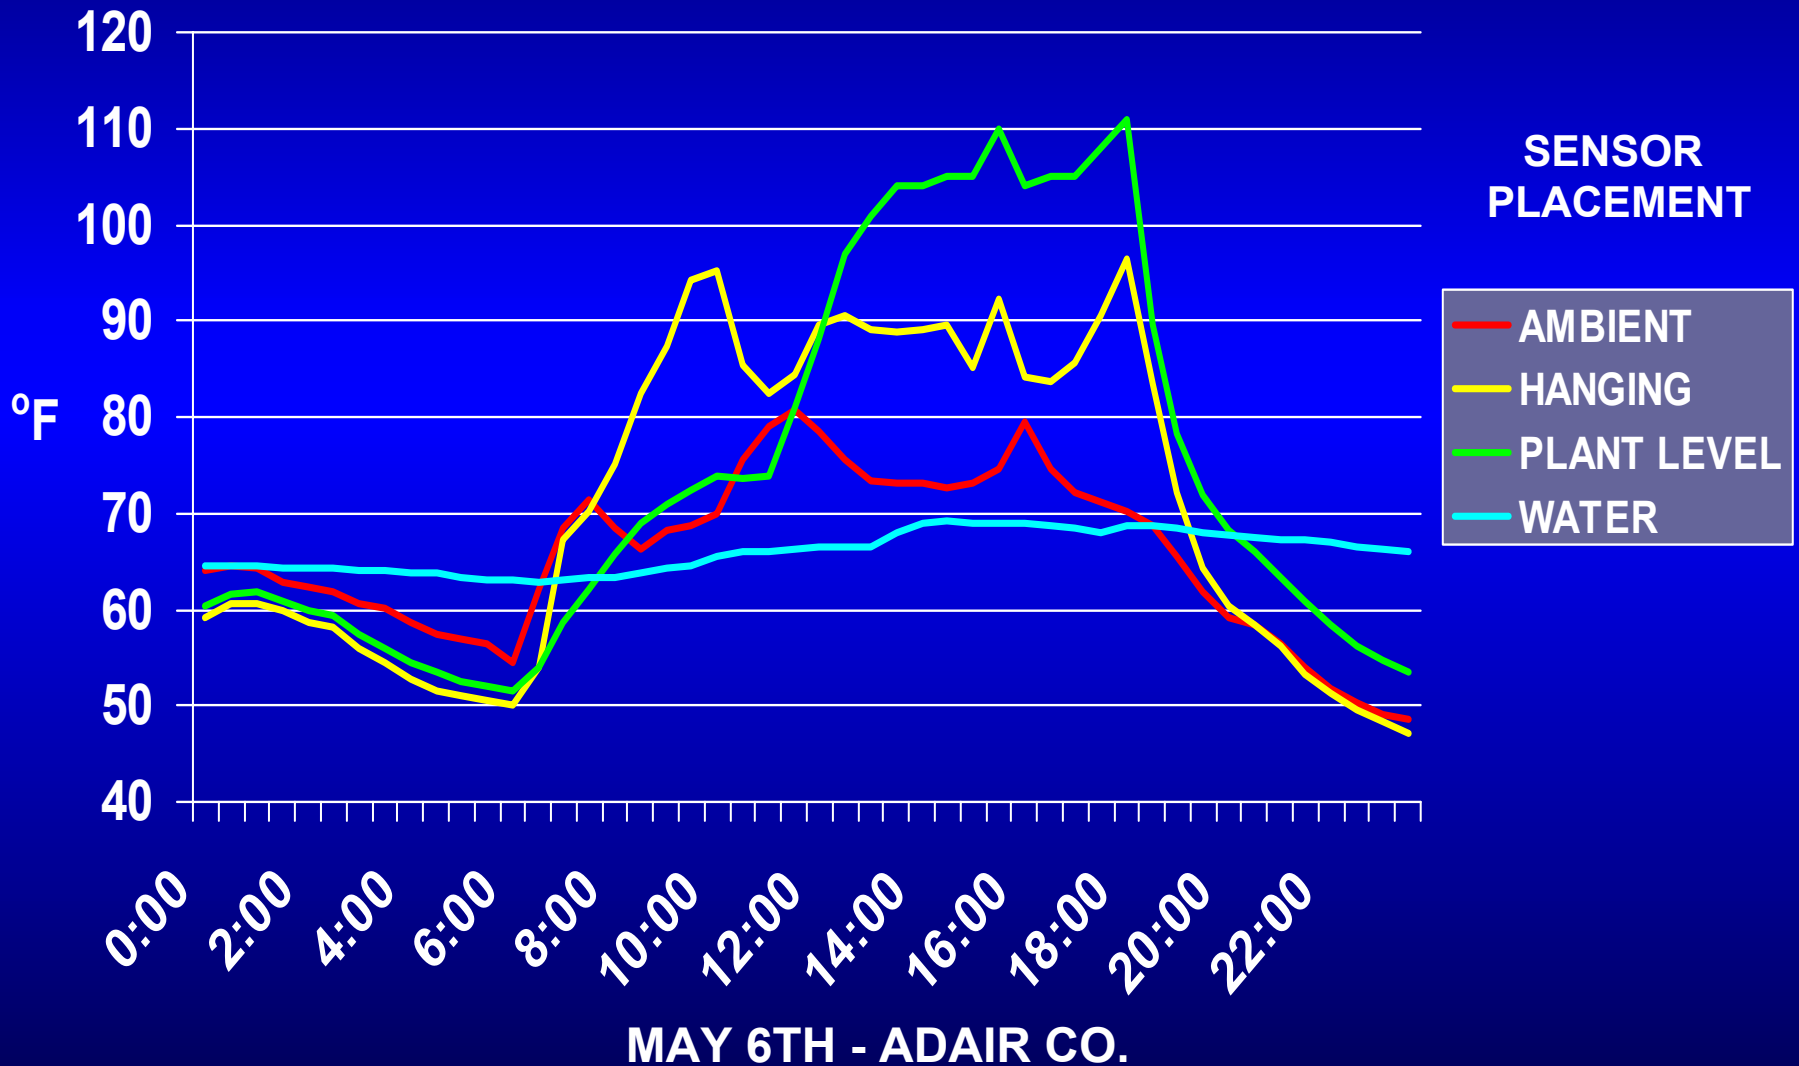

INFLUENCE OF FLOAT BED COVERS ON DAILY FLUCTUATIONS IN TEMPERATURE

MINI-GREENHOUSE TEMPERATURE STUDY

PERFORMANCE OF PRIMED SEED IN AN OUTSIDE FLOAT SYSTEM - CASEY COUNTY

	5	7	9	11	13	15
PRIMED	2.49	34.863	72.9	81.9	89.25	92.88
NONPRIMED	0.12	3.242	58.34	79.88	88.89	93

Thermostat

- **Locate near plant level**

- **Don'ts**

- **Locate on end walls**
- **Near cracks**
- **Doors**
- **Fans**
- **Shutters**
- **Locate in direct sun**
- **Distorts ventilation control**
- **Fans operate while heating is still occurring**

Greenhouses

● Germination

■ Optimum Temperature

● Soil

- 70° to 75°F

● Air

- Above soil
- High end 90°F
 - Damage or kill germinating seeds

Germination

● Variety

- TN 86 slow
- 7-14 days

● Chambers

- 3 ½ days
- High humidity
 - 90% +
- Optimum temperature (70° - 75 °)

Faster transplant growth

- Daytime temperatures
 - **70° to 80°F**
 - Lower temp/Slower growth
 - Nighttime temperatures
 - **60° to 70°F range initially**
 - **50° to 65°F**
 - *After four-leaf stage*
 - Conserves heating costs

Heaters

● Vented

■ Location

- Inside the greenhouse usually
- Some outside

■ Advantages

- Cleaner, safer environment
- Dry heat

■ Limitations

- large and heavy to mount to bows.

Radiant heaters

- Normally unvented
- Directs heat to soil and plant surfaces
- Less heating of the air
- Cleaner combustion
 - Reduces fuel usage
- Temperature control
 - More difficult
 - Sensor must measure soil/plant surface
- Goes through plastic
 - Extra heat loss can occur
- Moisture
 - Still produced
- Fresh air needed
- Cost of units
 - Usually higher than comparable air-heating units

Unvented

● Advantage

- Heat kept inside
- Simpler to install

● Location

- Inside or outside

● Limitations of Unvented

- High risk for plant damage from fumes
- Needs oxygen (fresh air) inlet to burn fuel
- Requires air outlet
 - Allow combustion products to escape
- Produces extra moisture
 - Humidity
 - Condensation

Combustion byproducts

● Ethylene

- *Causes necrotic spots, leaf curl & yellowing*
- Can harm tender young seedlings

● Sulfur dioxide

- Damages leaf tips

● Nitric oxide

● Carbon monoxide

- Very dangerous to humans

Thermostat

● Do's

- **Shade top and sides**
- **Allow free air circulation**
 - **Aspirated chamber or enclosure**
 - **Small fan moves air by the thermostats**
- **Located near plant level**
- **Mount to swing out of way of clipping system**

Ventilation

● Objectives

- Maintain the inside air and soil temperature below 85° to 90°F.
- Remove excess moisture
- Provide fresh air for heater fuel combustion

Side curtains

- Passive
- Allow natural air exchange
- **Dependent on Wind**
- **Thermal currents**
- Advantages
 - **Cost less**
 - **Can be automated**
 - *Reduce labor*
 - *Precise control.*

Limitations

- **Manual operation requires human presence**
- **No uniformity of temperature**
- ***Cold drafts***
- **Heaters may operate when open**
- **Air leakage**
- ***Non-tight fit***
- ***Added heat costs***
- **Require straight sidewall**

“Flushing” the air each evening and morning

- **Helps ventilate excess moisture**
 - **Opening side curtains**
 - **Operating the ventilation fans for several minutes**

Combination: Fans and Curtains

- Automates first stage

- Advantages

- Reduces human presence
- Drafts
- Potential cold injury

- Limitations

- Curtains have to be checked, opened or closed as required
- Tradeoff between costs and better temperature control

● **One-half air leakage per hour**

- **Dispel 22 pounds of moisture**
- **Assuming movement of 70°F, 90 percent relative humidity air out**
- **40°F, 50 percent air in, heated up to 70°F**
- **Equivalent to 400 to 500 cubic feet per minute (cfm) of steady fan capacity**

**Ventilation needs:
In 30 x 100-foot greenhouse**

Operate Fans in stages

- **1st stage**

- *20 percent of requirement*

- **2nd stage**

- *40 percent of requirement*

- **3rd stage**

- *40 percent of requirement*

Ventilation requirements

- **Air change per minute (CFM)**
- **Equivalent of removing and replacing all the air in the greenhouse once each minute**
 - **Spring & Fall**
 - *$\frac{3}{4}$ to 1*
 - **Ex. $\frac{3}{4}$ in 30 X 100 with 4 ft side wall**
 - **Summer**
 - *1 to 1.25*

Curtain Styles

● Manual Curtains:

- Role up
- Role down
 - *Reduces cold injury*
 - *Cold air mixes with inside air before dropping down onto the plant*

● Automated Curtains

- Operating by thermostatic control
- Reduce need for human presence
- Must be reliable
- Not overreact
- Open too wide
 - *Producing harmful drafts*

● Wind

- Velocity
- Direction
- Orientation

● Outside air temperature

● Air blockage

- Vegetation
- Buildings
- Two or more greenhouses side by side

● Width of the house

● Rule of thumb

- 1 foot sidewall opening per 10 feet of house width
- 30- to 36-foot houses
 - *3- to 4-foot opening*

Size
determination
for curtains

Shutter Installations

- **Gravity-type**
- **Opens before Fans**
 - *8 to 10 sec delay*
 - *Or thermostat set 2-3 degrees cooler*
- **Close when fan stops**
 - *Prevents cold air from entering*
- **Location**
 - **Opposite end of the greenhouse**

Shutter Size

- **Equal to the size of the fan**
 - Or 1.25 to 1.5 times larger
- **Located 3 feet above the plant level**
 - Minimizes drafts
 - Baffles deflect air upward
 - Provide mixing
 - Reduces cold injury

Air Circulation

● Forced air

- Uniform environment
- Improved plant growth
 - Horizontal air flow system
 - Simple & Common System
 - 16- to 24-inch fans
 - *Suspended in the greenhouse*

Locating a Circulation Fan

● *Spacing*

- 40 to 50 feet apart
- One-fourth of the house width from each sidewall

● *Height*

- Halfway between plant level and the roof

● *Angle*

- 10 to 15 degrees inward and downward

Moisture and Humidity

- Problem in most greenhouses
- Sources
 - Evaporation
 - Water surface
 - Soil surface
 - Transpiration
 - Combustion
- Condensation on plastic or structural surfaces
 - Surface cools to dew point
 - Drip
 - Erodes seedlings from tray cells
 - Causes disease problems
 - Corrodes structures and equipment

Double-layer plastic

- **Insulates better**
- **Warmer inside surface temperature**
- **Less condensation potential**
- **Condenses the excess moisture**
- **Provides Stability in high winds**
 - **Inflation Fan**

Problem Situations

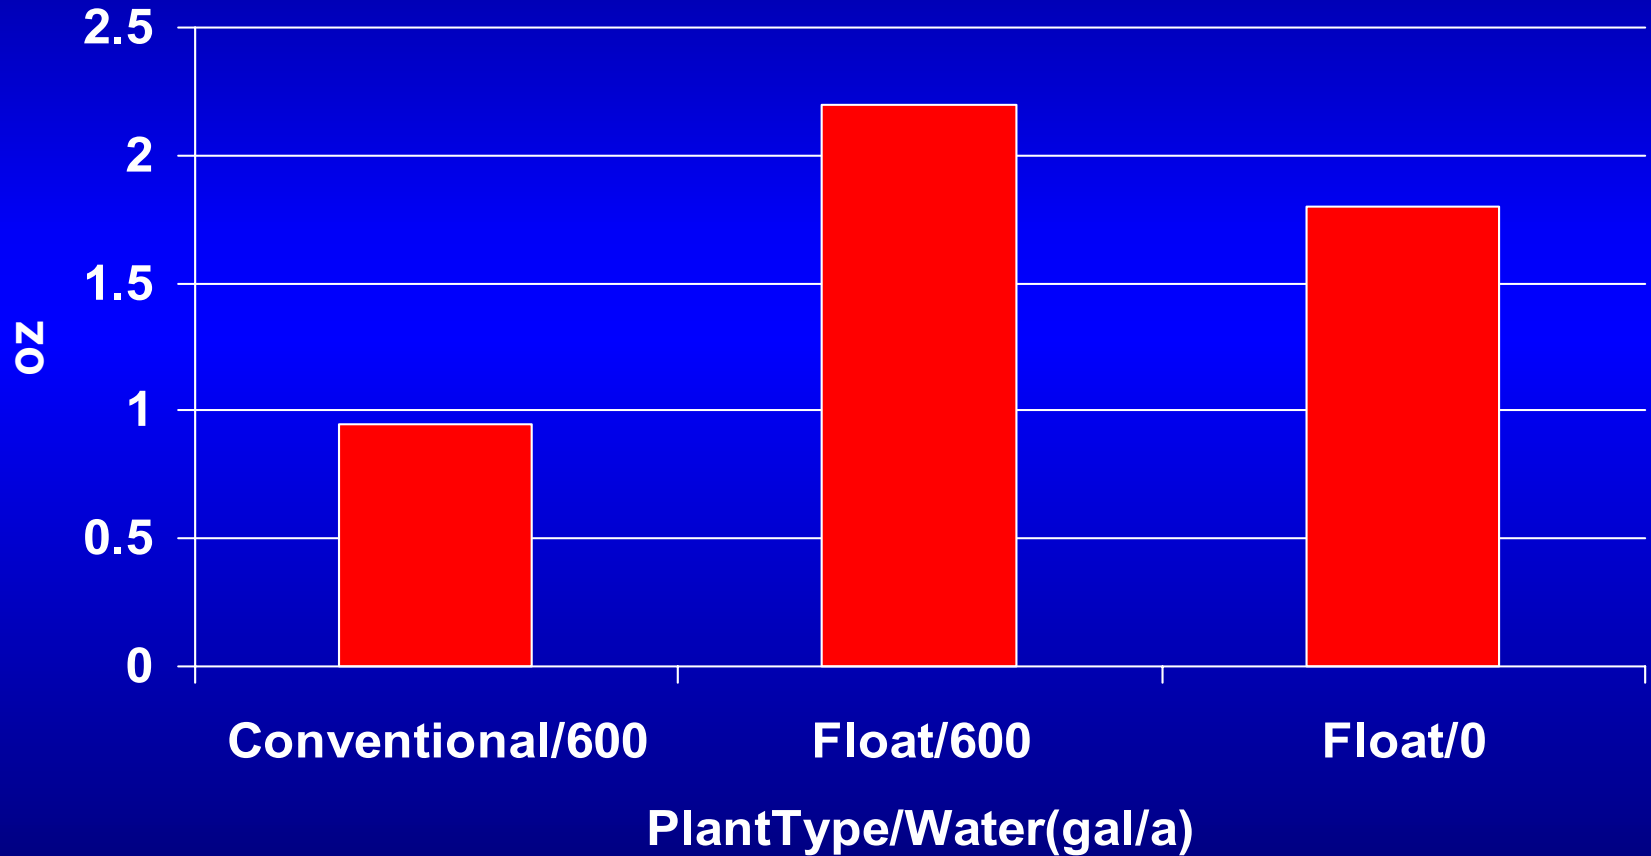

Moisture and Humidity

- **Run Small fan continuously**
- **Larger fan on interval timer**
- **Open side curtain**
 - **Downwind side**
 - **1 to 2 inches**
 - **Causes heat loss**
 - **Cost of reducing high humidity and condensation**

Float Systems

- Advantages over conventional plant beds
 - Producer has control of growth
 - Timing
 - Set all day
 - More set per day
 - More time for other farming activities
 - No transplant shock
 - ***More uniformity***
- Disadvantages
 - Allows producers to set more than can manage
 - Tend to set shallow

Root Development of Float Plants

Float Systems

● Plug & transfer

- Trays seeded and plugs produced by 2nd party
- Bought by producer at 4 week old

Plug & transfer

- Transferred to Finishing Tray
- Advantages
 - Difficult part is over
 - Plants are more uniform
- Disadvantages
 - Cost
 - Labor

Plug & Transfer

- Fill Trays with Media
 - Do not over fill
- Transfer to Finishing Tray
 - 1000+ /hr
- Place on Bed
 - Avoid Excessively Cold, Windy Weather
 - Must have 2 to 3 days to acclimate

Direct Seeding

- Seed Pelletized Seed into Finishing Tray
- Place in outside Float System or Greenhouse

Dibble

- Depression for seed
- Micro climate
- Depth $\frac{1}{4}$ to $\frac{3}{4}$
- Type
 - Round
 - Pyramid
 - Mechanical

Mechanical seeding

- Automated seeding
 - Pelleted seed
 - Singulation
 - Placement
 - Fast/high capacity
 - Drum

Hand Seeder

● Vacuum

- Most common
- Quicker
- Holes may plug
- Noisy

● Portable

- Material
 - Plexi-glass
- Slower
- Double seed
- Static electricity

Media

● Characteristics

- Solid particles of medium
- Pore space
 - Small Pore Space
 - Capillaries
 - Water coating surfaces of particles
 - Large Pore Space
 - Air occupying the center pores
 - Drainage
- Cornell mix
 - 50% peat moss
 - 50% vermiculite

Components of media

● Peat moss

- Water & nutrient retention and rooting
- Maintains root ball
- Initially hydrophobic
 - **Wetting agents**

● Vermiculite

- Water & nutrient retention and rooting
- Heat expanded mica
 - Glassy material in flat layers

Components of media (cont'd)

● Perlite

- White, crumbles easily
- Aeration
- From glass-like volcanic rock

● Polystyrene beads

- Aeration
- Drainage

● Rock wool

- Water retention and aeration
- Spun molten rock

● Coir - Coconut hull fiber

- Water & nutrient retention and rooting
- Does not maintain root ball

Trays

● Sizes & attributes

- 200 = 27cc v shaped bevel
- 242 = 23.6cc straight side wall beveled at bottom
- 253 = 16cc shallow v shaped bevel
- 288 = 17cc straight side wall beveled at bottom
- 338 = 13.6cc v shaped bevel
- 595 plug tray 1 inch deep |
- 882 plug tray $\frac{3}{4}$ inch deep | Not suited for float system

Tray filling

● Methods

- Hand –

sift soil on top allow gravity to fill, clean with straightedge

- Hopper box - prevent weight of media from pressing on tray.

Over Packing

- Saturation of media
- Heavy tray
 - 200 cell tray = 8.3 lbs
- Tray sinks lower into water

Over Packing

- Algae

- Nitrogen
- Sunlight

- Slow plant growth

Over Packing - Spiral Root

Spiral root

● Causes

- Hard Seed Coat
- Drying Conditions
 - Sunny, hot weather
- Poor Wicking Media

Fertility

● Water volume

- Tray # X depth in inches X 1.64
- Example: $759 * 4.5 * 1.64 = 5600\text{gal}$

● Fertilization

■ Nitrogen

● Amount

- 100 ppm ideal

● Calculations

- 20-10-20 to get 100 ppm N
- Water = 8.34 lb/gal
- $8.34 * 1000 \text{ gal} = 8340 \text{ lbs}$
- $100 \text{ ppm} = 1/10000$ or $.834 \text{ lb} / 1000 \text{ gal}$
- 20-10-20 is 20% N. $.834/20\%$ or $.834/.2 = 4.17$ or 4.2
- If 15-5-15 - $.834/.15 = 5.56 \text{ lbs.}$

Source of Nitrogen

● Nitrate

- Best
- Readily available form

● Ammoniacal

- Marginal
- Ammonium form

● Urea

- Worst
- Can convert to ammonia or nitrite which can be toxic to plants

Estimating fertility

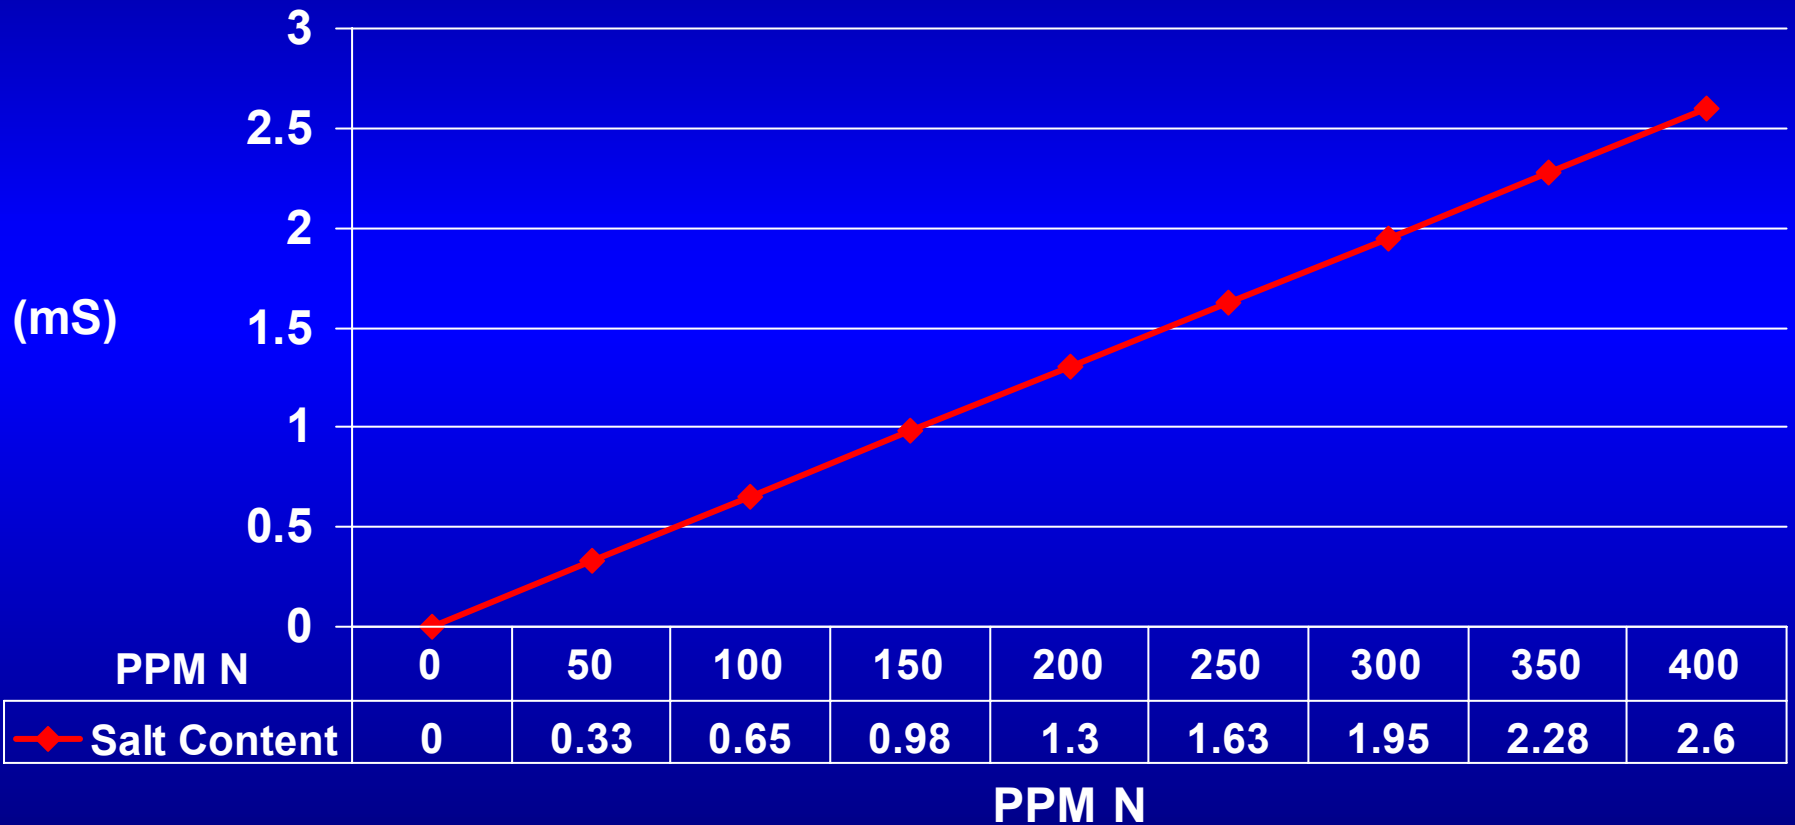

- Conductivity - Measure of electrical flow
 - Units
 - mS milli-Siemens
 - 100 micro-Siemens or mmhos
 - Method
 - Take water source reading (ex. 0.4)
 - Measure fertilized water (ex. 1.3)
 - Know fertilizer conductivity (ex 20-10-20 is .33/50 ppm)
 - $1.3 - 0.4 = .9$, $.9 / .33 = 2.73$
 - $2.73 * 50 = 136$ ppm

CONDUCTIVITY READINGS

STANDARDS CHART FOR 20-10-20

1 mS (DiST 4 meters)

1. TAKE WATER SOURCE READING (PLAIN WATER)
2. TAKE FERTILIZED WATER READING
3. SUBTRACT WATER SOURCE FROM FERTILIZED

EXAMPLE: IF PLAIN WATER = .4 & FERTILIZED WATER = 1.4,
 $1.4 - .4 = 1.0$, PPM N = 150

Clipping

● Clipping

- 3 – 5 times
- 1st level bed
- Remove small amount

● Benefits

- Uniformity
- Stem diameter
- Toughness

Clipping

● Types

- Rotary mower
 - Sharp blade
 - Slow speed
- Electric
 - One speed (fast)
 - Rheostat

Reel mower

- Cuts whole pieces
- Cuts in one direction
- less maneuverable

Tray sterilization

- Contaminated trays
 - New trays versus old
- Bleach 10%
- Steam
 - must reach 140° F for 30 min
 - 180° F damages Trays
- Methyl Bromide
 - Cheap
 - Quick
 - Dangerous
 - Environmental concerns
