

New College of Agriculture Web Design Standards

- Web sites developed and supported by Agricultural Communications Services will either be in Dreamweaver or Drupal. We will not be developing or supporting sites built with other software.
- Mozilla Firefox is the browser to be used when editing a Drupal web site. Firefox is a free browser and is well respected in the industry. We are only recommending using Firefox for use in editing Drupal and not for other applications. If you do not want to use Firefox, we would recommend NOT building your site in Drupal.
- All sites now in development will contain the new college navigation header and existing sites will be updated with the new header.
- The goal is to have the new header on all sites within six months. Those with existing sites can go to the Ag Com home page, <http://www.ca.uky.edu/agcomm/>, click on the New College [Navigation Header](#) for instructions on placing the new header on your web pages or to ask for help.
- This may be a good time to consider if you need a site update and that request can be made through our web site as well using the [project clearance sheet](#).
- For more information please contact [Becky Simmermacher](#), section manager, Integrated Media.
